ABSTRACT

Background: Tulsi (Ocimum sanctum L.) common household plant, a potent adaptogen has been used for its medicinal property for many years. It is known in Ayurveda as Incomparable one, Mother of medicine of Nature and The Queen of Herbs. The present study evaluated the stress induced anti-ulcer effect of tulsi leaves in albino rats.

Methods: Albino rats were randomly, allocated to different experimental groups and aqueous leaf extract of Tulsi (Ocimum sanctum) is given for 7 days. Gastric ulcers were induced by cold restrain methods and results were compared with control using distilled water and standard drug Ranitidine.

Results: The Anti-ulcer effect of aqueous extract of Tulsi was significant in a dose dependent manner with cold restraint model. The percentage of ulcer protection of Tulsi leaf extract at dose 100mg/kg is 68.85% and at dose of 200mg/kg showed 65.66% and the standard drug Ranitidine showed 78.23% ulcer protection which is significant (p<0.05).

Conclusions: The study showed that when Tulsi (Ocimum sanctum) is given at dose 100-200mg/kg for 7 days i.e., pre-treatment in rats for anti-ulcer effect, it caused a significant reduction in the ulcer scores and ulcer index when compared with control group, as evidenced by the gross appearance and histological findings of gastric mucosa in rats. There were few signs of mucosal injury and the percentage of damage was less compared to control group. Serosal surface revealed very few dilated blood vessels and petechial hemorrhages and mucosal surface had few ulcers of varying sizes.

Keywords: Cold restrain ulcers, Peptic ulcer, Tulsi

INTRODUCTION

Peptic ulcer is a chronic disease which impairs the quality of life and is associated with increased morbidity and mortality. Imbalance between the “aggressive” (acid, pepsin and H. pylori) and “defensive” factors (mucin, prostaglandin, bicarbonate, nitric oxide and growth factor) and presence of acid-pepsin play an important role.¹,² Peptic ulcer disease is a worldwide problem and its treatment is essential.

Stress is common and universal feature in human life now a days. Stress is involved in the pathogenesis of a variety of diseases that includes psychiatric disorders such as depression and anxiety, immunosuppression, endocrine disorders including diabetes mellitus, male impotence, cognitive dysfunction, peptic ulcer, hypertension and ulcerative colitis.³

In the cold-restraint stress model, gastric ulcer formation was mainly due to gastric hypermotility, which could lead to mucosal over friction. Hence, the gastric mucus layer is extremely important and the mucus is generally believed to contribute to a cytoprotective action.³

The large numbers of drugs in use are derived from plants because of their easily available, safety, effective and more
important economical. The medicinal plants are rich in secondary metabolites (which are potential sources of drugs) and essential oils of therapeutic importance. Plants are the source of certain known anti-ulcer drugs. Tulsi has been reported in traditional medicine to possess anti-inflammatory, anti-stress and anti-bacterial properties.

According to World Health Organization, medicinal plants are the best source to obtain a variety of newer herbal drugs. About 80% of individuals from developed countries use traditional medicine, has compounds derived from medicinal plants therefore, such plants should be investigated for better understanding of their properties, safety and efficacy.

METHODS

Animals

Albino rats of either sex weighing between 150-200gms were used for the study and were randomly, allocated to different experimental groups and placed individually in cages. Care being taken to avoid coprophagy, by keeping the animals in cages with grating floor. If coprophagy was detected such animals were excluded from the study. Animals were kept at room temperature and 12; 12 hours, light darkness cycle was maintained.

Tulsi leaves extract (aqueous) obtained from S. J. Herbals and Health Care, Bengaluru, Karnataka, India. The extract was stored in cool and dry place. Accurately weighed quantity of extract suspended in distilled water and administered orally to rats using feeding tube.

Drug

Standard drug used is Ranitidine obtained from Saraca Laboratories Limited. It was suspended in distilled water and administered orally through feeding tube.

Methods of inducing stress ulcers in rats

Cold restraint method

Rats were immobilized in stress cage and kept in refrigerator (4-6°C) for 3 hours. The animals sacrificed by stunning method and the severity of mucosal lesions were scored as ulcer index.

Pretreatment - Rats were given Tulsi leaf extract for of 7 days. After 7 days Rats was kept fasting for 12 hrs, then subjected to stress and sacrificed by stunning method. The stomachs were opened along the greater curvature and the stomach was isolated and washed in normal saline. Those stomachs were fixed on wooden board with the help of pins. The stomachs were observed with the help of magnifying lens and studied its external and internal surface and observed hemorrhage, dilation of blood vessels, ulceration, perforation, size and number of ulcers and ulcer index was evaluated according to the severity of ulcers. The stomach was stored and fixed in 5% formalin.

The percentage of ulcer inhibition calculated by formula

\[
\text{Percentage of ulcer inhibition} = \frac{\text{Mean Ulcer index (Control)} - \text{Mean Ulcer index (Treated)}}{\text{Mean Ulcer index of control}} \times 100
\]

Ulcer indexing

The dissected-out stomachs were cut open along the greater curvature and the inner surface was examined for ulceration. The open stomachs were fixed on to a board with the help of pins and studied by individuals who were blinded for test drugs and control animals.

Evaluation of ulcers

- 0 - No pathology
- 1 - A small ulcer (1-2mm)
- 2 - Medium ulcer (3-4mm)
- 4 - Large ulcer (5-6mm)
- 8 - Large ulcer (> 6mm)

Total severity of scores

Ulcer index = -----------------------------------

Number of animals

Histological studies

A portion of the ulcer region in the stomach was dissected out and fixed in 5% buffered neutral formalin solution for histological observations. After fixations, tissues were embedded in paraffin, solid sections were cut at 5μm and stained with hematoxylin and eosin. The sections were examined with the help of a pathologist under light microscope and photomicrographs were taken.

Statistical analysis

Data is expressed as mean ± SEM. Data was by one-way ANOVA followed by LSD and Scheffe’s multiple comparisons test. The significance of difference was accepted at P <0.01.

RESULTS

Gross appearance of gastric mucosa in rats

On gross examination, serosal surface of stomach showed marked induration, dilated blood vessels, ecchymosis and hemorrhagic sites. Mucosal surface presented with features of severe degree of hyperemia, congestion and large number of pin point ulcers of varying sizes with central clots, features of perforation in the stomach. The ulcer index was high. Microscopic features were
suggestive of acute gastric ulceration with de-epithelialization.

Animals treated with ranitidine maintained near normal pattern. Serosal surface looked amber coloured with few signs of dilated blood vessels and haemorrhagic suffusions. Mucosal surface retained the normal rugae pattern with minimal signs of mucosal injury. The ulcer index was markedly reduced.

DISCUSSION

Many factors have been associated with peptic ulcer, most important of which is stress. Drugs available for peptic ulcers in the market were limited by presence of several adverse, hence focus has shifted towards natural products as the new sources of antiulcer agents. With the increasingly growing interest in natural medicine, various...
plants have been studied based on the traditional knowledge of their pharmacological properties and confirmed to be useful in treatment and management of various diseases including gastric and duodenal ulcer. Tulsi has been one of the most noteworthy plant mentioned in various medicinal systems. In addition to other therapeutic properties, O. sanctum is also reported to possess anti-ulcerogenic activity. The stem and leaves of Tulsi contain a variety of phytochemical constituents that may have biological activity, including saponins, flavonoids, triterpenoids, and tannins. In addition, the following phenolic actives - Rosmarinic acid, apigenin, cirsimaritin, isothymusin and isothyminon have been identified, which also exhibit antioxidant and antiinflammatory activities.

The present study is undertaken to produce gastric ulcers by cold restraint models in albino rats. It is a well-accepted model for the induction of gastric ulcer and provide both emotional stress as well as physiological stress to the animal. The percentage of ulcer protection of Tulsi leaf extract 100mg/kg and 200mg/kg and standard drug ranitidine were almost comparable. Therefore, the results were suggestive of anti ulcerogenic activity of Ocimum sanctum at the dose 100-200mg/kg.

Tulsi has been reported to possess adaptogenic activity, its anti-ulcerogenic effect may be due to its effect on neural pathways controlling acid secretion thereby strengthening the animal’s physiological capabilities to decrease stress and hence ulcers.

Accordingly, the protective action of Tulsi against stress-induced ulceration could be due to its histamine antagonistic, anticholinergic and antiseretory effects.

However, further study is required to know the exact mechanism of action and to isolate the active molecule responsible for the anti-ulcer activity.

CONCLUSION

The finding of the present study demonstrated that Tulsi leaf extract (Ocimum sanctum) at dose of 100mg/kg showed 68.85% ulcer protection and at dose of 200mg/kg showed 65.66% ulcer protection which is significant (p <0.05) anti-ulcer effect in Cold restraint stress method and the standard drug Ranitidine, a H2 receptor antagonist commonly prescribed in stress ulcers has shown more potent 78.23% in comparison to Tulsi against cold restraint ulcer, as evidenced by decrease in number and severity of the ulcer and the reduction in the ulcer scores. However more experimentation and clinical studies and detailed analysis are required for a definitive conclusion.
