Interns perception towards Pharmacology during clinical postings at RIMS, Raichur, India

Neeta T. Gavimath¹, Vasant R. Chavan¹, Rohit Dixit²*

ABSTRACT

Background: Every medical graduate must have the intention to prescribe rationally. It is pharmacology which teaches rational of prescribing of drug in undergraduate medical course. Therefore, many eminent medical educationists believe that pharmacology is the most essential part of the medical curriculum. Medical graduates join as interns in their respective teaching hospital immediately after graduation. Although interns work is usually under the supervision of a senior consultant but there are occasions, when they need to make their own decision. Internship is the intermediate period between under-graduation and general practice. The dexterity of health professional relies upon prescribing practices. Clinical pharmacology and therapeutics (CPT) is a crucial discipline for interns to acquire safe and rational prescription of drugs. This study was conducted with the intention to provide some light about the knowledge of pharmacology among the interns in RIMS Hospital Raichur, Karnataka.

Methods: The study was done on interns of RIMS, Raichur. It was a descriptive questionnaire-based prospective study. A structured questionnaire modified from the work of Oshikoya et al, was used in the study which included four major categories namely basic demographic information, undergraduate CPT teaching, experience of adverse drug reaction (ADR) and any deficiency in the undergraduate CPT teaching.

Results: Out of these 107 participants 54 (42%) rated pharmacology knowledge is good, while another 53 (40%) had average understanding. As high as 80% (85) intern population feel that undergraduate training has prepared them to prescribe safely. 45 (41%) interns have already observed cases of adverse drug reactions in their short active clinical life.

Conclusions: The present study has identified that pharmacology and therapeutics course curriculum is not enough to produce safe prescribers.

INTRODUCTION

Pharmacology is one of the essential components in clinical practice. Prescribing correct therapy is the essential part of physicians and therefore, adequate knowledge on drugs’ efficacy, safety, cost, and convenience is important.¹ Lessons in Pharmacology provide and enrich medical students’ knowledge and skill about different drugs and their utility in various diseases.² The important goal in teaching of undergraduate students in pharmacology is to inculcate a rational and scientific basis of therapeutics. Clinical Pharmacology and Therapeutics (CPT) is a crucial discipline to acquire these competencies. Cultivating sound knowledge about CPT in under graduation and internship is, henceforth, compulsory. Hence the Indian government has progressively integrated CPT into undergraduate curriculum.¹

Integrated teaching method includes teaching in organ system based manner rather than didactic lectures. The benefits are widely discussed by WHO.³
Fresh medical graduates very often need to prescribe many times a day. Every medical doctor needs to develop the skill to select the right medicine for any disease from a very wide range of therapeutic choices.\(^4\) Pharmacology should be taught aiming to produce future rational prescriber. Erroneous choice of drug is one of the top medical errors and as high as 2% of all hospital admission in USA is due to ‘medication errors’ with majority of paediatric patients.\(^5\)\(^-\)\(^8\)

Medical error results in 44,000-98,000 unnecessary deaths each year and 1,000,000 excess injuries in the United States of America.\(^9\) Again these mistakes and faults are mostly due to poor prescribing skill.\(^5\)\(^-\)\(^10\) Inadequate prescribing knowledge and skill in the both developed and developing countries are also reported in numerous published articles.\(^11\)\(^-\)\(^18\)

According to Medical Council of India (MCI), under “Regulations of graduate medical education”, 1997, Medicinae Baccalaureus, Baccalaureus Chirurgiae (MBBS) is a certified study extending over four and half academic years divided into nine semesters followed by one year Compulsory Rotatory Residential Internship (CRRI). The period of four and half years is divided into three phases;

Phase-1 (2 semesters) which includes pre-clinical subjects viz Human Anatomy, Physiology, Biochemistry and introduction to Community Medicine including Humanities;

Phase -2 (3 semesters) consisting of Para-clinical / clinical subjects viz Pathology, Pharmacology, Microbiology, Forensic Medicine including Toxicology and part of Community Medicine;

Phase-3 consists of continuation of study of clinical subjects for 7 semesters after passing phase-1 and the clinical subjects are medicine and its allied specialities, surgery and its allied specialities, Obstetrics and Gynecology and community medicine.

No student shall be permitted to join phase-2 group of subjects until passing all the phase-1 subjects. Overall didactic lectures were allotted one third of time schedule whereas two-third for practical, clinical or/ and group discussion.

**METHODS**

The study was conducted in a tertiary care hospital, Raichur, Karnataka, India. As a tertiary care hospital, the health care services offered are comprehensive covering investigation, diagnosis, therapy, surgery and post-operative care. The in-patient services are complemented with day centers, outpatient facilities. It teaches both under-graduate and post-graduate students. This study was conducted after obtaining approval from Institutional Ethical Committee.

**Development of questionnaire**

It was a descriptive questionnaire-based prospective study. A structured questionnaire modified from the work of Oshikoya et al, was used in the study which included four major categories namely basic demographic information, undergraduate CPT teaching, experience of adverse drug reaction (ADR) and any deficiency in the under-graduate CPT teaching.\(^8\) There were 22 questions which were mostly yes/ no type or multiple choice types. In multiple choices, more than one choice was allowed to be chosen. Fill in the blank type questions were also included.

**Participants**

The participants were interns of the college from first and supplementary batch. The study was conducted from February 2018 to July 2018. The interns were either in the end or middle of their internship. A total of 107 interns participated in the study. Informed written consent was obtained prior to their participation in the study. The questionnaire was filled on the spot. Confidentiality was assured.

**Statistical analysis**

Data were entered and analyzed using SPSS software (SPSS v16.0). The data were expressed through descriptive statistics.

**RESULTS**

Out of 107 respondents, 53% were male and 47% were female out of which 64% were 22 years old, whereas 35% and 1% were 23 and 24 years old respectively. 81% of interns were aware of CPT which was taught during undergraduate period, whereas 19% were not aware of CPT. 56% of interns were satisfied with undergraduate CPT teaching and 44% were not satisfied as shown in Figure 1.

**Figure 1: Knowledge about clinical pharmacology and therapeutics in percentage.**

Among the respondents, 51% of interns considered themselves capable of rational prescription, whereas 45% were not. 74% of participants had encountered problem while prescribing the drugs during their internship period.
whereas 31% were not. The various problems encountered during the internship by the interns while prescribing is shown in Figure 2. 76% felt that experience is needed for prescribing; 47% and 31% felt that confidence and availability of advice and reference will improve prescribing ability.

**Figure 2:** Problems encountered while prescribing during internship represented in percentage.

**Figure 3:** Drugs prescribed by interns without supervision in percentage.

**Figure 4:** Prescription of drugs under supervision (for special cases) expressed in percentage.
The various drugs which could be prescribed by the interns without the guidance of senior or faculty member is shown in Figure 3. Similarly, the interns required guidance/advice from the senior or faculty member while prescribing different groups of drugs for special cases like elderly people, children, pregnant women or people with systemic diseases (renal/liver impairment).

Out of 107 respondents, 80% of the interns felt that while prescribing safety of the drug was very important; 34% considered efficacy of drug as important; 40% considered cost (pharmacoeconomy) as important factor and 5% of respondents felt that tolerance (or) resistance, age factors, life style factors, patient compliance, adverse drug reaction and age related dosage, combination of drugs should also be considered while prescribing.

Regarding adverse drug reaction, 90% of individuals were aware of adverse drug reaction. 47% had seen different types of adverse drug reaction during their internship period and 45% had seen during their training period. Figure 5 shows the reasons for adverse drug reaction as suggested by interns.

Out of 107 respondents, 67 interns felt that they would avoid adverse drug reaction using their undergraduate knowledge. Before prescribing the drug, 74% of the respondents had the habit of checking information about the drug profile and the main sources were CIMS/ MIMS/ refRx etc (50%), text book of Pharmacology- Tripathi (50%), drug information literature slips given along with drug (4%) and Washington manual (1%). Though majority of respondents had knowledge about adverse drug reaction and its consequences, more than 50% of the interns felt that CPT training should be improvised in following areas like adverse drug reaction (31%), dosage (20%), emergency medication (20%), pediatric medication (18%), therapeutic drug monitoring (9%), selection of antibiotics (19%), drug dosage (7%), insulin dose calculation (10%), antihypertensive (4%), drug interaction (4%), drug combination (3%), dosage calculation (5%), vaccination (5%), route of administration (2%), poisoning (5%), pharmacodynamics of drug (2%) and cytotoxic drugs (1%), drugs with narrow therapeutic margin/window (0.5%).

**DISCUSSION**

Gaining knowledge and implementing the same in clinical practice is the integral part of learning medicine. Learning CPT plays an important role in the development of rational and effective prescribing skills by the medical students. In our study majority of the respondents were aware of the CPT and rated their knowledge as average. However nearly half of the respondents were only satisfied with CPT teaching and feel confident about their rational prescribing skills whereas the rest were not which is quiet similar with a study done in other places where the main mass of the study population agreed that their knowledge of
pharmacology and therapeutics is from average (40%), good (42%), and excellent (7%) which is quite similar with findings of Nigeria. Prema et al, also obtained similar result regarding students acknowledgement about prescription writing and rating of CPT. Kazeem et al, also conducted similar study on interns at Nigeria and obtained the similar result. However majority of them encountered problem during prescription which didn’t correlate with previous data and problems mainly were calculation of doses, trade name of drugs and selection of drugs. One study conducted on drug dose calculating skills showed from junior and newly graduated doctors lagging behind in their dosage calculating skills and only half of interns had always double-checked their calculated doses. Similarly in another study conducted in Nepal suggested that training sessions on dosage calculation to be done at undergraduate level in Pharmacology as well as reinforcement of the same by various clinical departments had been insisted.

Another important drawback at UG level is memorizing doses rather than calculating doses at pediatric level and this leads to more prescription error. So, training the undergraduate students on dose calculation and exposure to selection of drugs at clinical side is inevitable. This would prepare them for safe prescription later during their practice. Also, majority felt that clinical experience would improve their prescribing ability. But the lacunae at our setup are the enforcement of theoretical knowledge rather than practical teaching at undergraduate level. By exposing those to practical training and reassessment of their talents will bring confidence and practicing skills in them. CPT teaching could be made interesting by group discussion in clinical oriented pharmacology teaching rather than seminar according to one study. Drugs they managed to prescribe confidently without supervision were NSAIDS, vitamins and minerals, antihistamines, antacids, antibiotics, antiemetics, antiasthmatics, and inhalers; similar results were seen in a study conducted by Rehan et al. Antibiotics, non-steroidal anti-inflammatory drugs seem to be common cause of ADR at hospitals and common ADR being gastrointestinal bleeding due to drug therapy.

Eighty-three percent of the study respondents feel retrospectively that Pharmacology and Therapeutics course should be improved to ensure rational prescribing. They have suggested some means for improvement and also identified a number of areas. This outcome is correspondingly quite comparable with a number of studies done in European countries and Canada. Although majority of the interns demanded they are competent enough to prescribe safely (80%) and rationally (65%). Furthermore, same study population has identified at least 12 areas they have specific problems which include chronic obstructive pulmonary disease, bronchial asthma, hypertension, diabetes mellitus, rational use of analgesics and antibiotics, paediatric doses, duration of drugs.

They also made a long list of drugs they are quite reluctant to prescribe. Also, the other drugs, where interns mentioned that they were confident to prescribe unsupervised, were also associated with several ADR. Prescribing errors were common with the interns due to number of factors during internship like lack of drug knowledge, increased workload, poor guidelines and inadequate supervision. Majority of interns were not confident to prescribe drugs for special categories like elderly, pediatric, pregnant women and patient with systemic illness. Hence more emphasis should be given at undergraduate level at these areas also. Only few were confident to prescribe NSAID and antibiotic. However, this confidence seemed to have gained because of repeated usage in clinical posting rather than knowledge about the drug. This also attributes to increasing number of prescription errors. According to majority, safety of patient was considered as prime importance whereas few mentioned the need to consider the cost and efficacy of the drug during prescription which is a good lead for rational prescription of drugs.

Despite limitation of this cross-sectional study, this study identified that pharmacology and therapeutics course curriculum is not enough to produce safe prescribers. Therefore, there is an urgent need of modifying pharmacology course curriculum.
