INTRODUCTION

Quinolone antibiotic comes under the group of broad-spectrum antimicrobial that share a bicyclic core structure related to the compound 4-quinoline.¹ They are used in human and veterinary medicine to treat bacterial infections, as well as in animal husbandry. Nearly all quinolone antibiotics in modern use are fluoroquinolones, which contain a fluorine atom in their chemical structure and are effective against both Gram-negative and Gram-positive bacteria. One example is ciprofloxacin (Cipro), one of the most widely used antibiotics worldwide.²³ Fluoroquinolones are often used for genitourinary infections and are widely used in the treatment of hospital-acquired infections associated with urinary catheters. In community-acquired infections, they are recommended only when risk factors for multidrug resistance are present or after other antibiotic regimens have failed. However, for serious acute cases of pyelonephritis or bacterial prostatitis

ABSTRACT

Background: Fluoroquinolone eye drops is being prescribed by Ophthalmologist in many ocular diseases as conjunctivitis, keratitis, bacterial corneal ulcers etc in more and more amount. There are many brands of fluoroquinolones drugs available in Indian market. Costly drugs can lead to economic burden on patients. Modifications in pharmaceutical policy are required, and prices of the drug should be controlled in effective way for all the drugs. Hence this study was done to assess the cost variation of fluoroquinolones opthalmic solutions available in Indian market.

Methods: The maximum and minimum price of each brand of the drug in INR was noted by using CIMS January to April 2020 edition and Drug Today April to June 2020 volume 1. The cost ratio and the percentage cost variation for individual drug brands was calculated. The cost of each eye drop was calculated. At last the cost ratio and percentage cost variation of various brands was compared.

Results: Percentage variation in cost for fluoroquinolones eye preparations marketed in India was found to be Eye drop Ciprofloxacin (0.3%) of 5 ml:210.39, Eye drop Ciprofloxacin (0.3%) of 10 ml:162, Eye drop Gatifloxacin (0.3%) of 5 ml:156, Eye drop Moxifloxacin (0.5%) of 5 ml:196.95, Eye drop Ofloxacin (0.3%) of 5 ml:245.16, Eye drop Ofloxacin (0.3%) of 10 ml:62.5, Eye drop Norfloxacin (0.3%):120.68, Eye drop Sparfloxacin (0.3%):8.31, Eye drop Lomefloxacin (0.3%):16.17.

Conclusions: There is a wide difference in the cost of different brands of fluoroquinolones eye preparations available in India. The clinicians prescribing these drugs should be aware of these variations in cost to reduce the cost of drug therapy.

Keywords: Fluoroquinolones, Percentage cost variation, Keratitis, Bacterial corneal ulcer, Conjunctivitis
where the patient may need to be hospitalised, fluoroquinolones are recommended as first-line therapy. Fluoroquinolones are featured prominently in guidelines for the treatment of hospital-acquired pneumonia. Quinolones and fluoroquinolones are chemotherapeutic bactericidal drugs, eradicating bacteria by interfering with DNA replication. Quinolones inhibit the bacterial DNA gyrase or the topoisomerase IV enzyme, thereby inhibiting DNA replication and transcription. Topoisomerase II is also a target for a variety of quinolone-based drugs. High activity against the euukaryotic type II enzyme is exhibited by drugs containing aromatic substituents at their C-7 positions. If tendonitis occurs, it generally appears within one month, and the most common tendon that is injured appears to be the Achilles tendon. Nervous system effects include insomnia, restlessness, and rarely, seizure, convulsions, and psychosis. Fluoroquinolones prolong the heart’s QT interval by blocking voltage-gated potassium channels. Topical antibiotics are recommended in many ocular infections as bacterial corneal ulcer or conjunctivitis, keratitis, post operative ocular surgery.

**METHODS**

Price in INR of fluoroquinolones eye drops manufactured by different pharmaceutical companies in India, in the same or different strength was obtained from “Current Index of Medical Specialties” (CIMS) January to April 2020 edition and Drug Today April to June 2020 edition, volume 1 as they are readily available source of drug information and are updated regularly.

The drug formulation being manufactured by only one company or being manufactured by different companies; however, in different strengths were excluded.

**DISCUSSION**

People living in developing countries pay heavy cost of medicines. The Indian market has over 100,000 formulations and there is no system of registration of Medicines. More than one company sells a particular drug under different brand names apart from the innovator company. This situation has led to greater price variation among drugs marketed. These wide variations in the prices of different formulations of the same drug have severe economic implications in India. People in developing countries pay the cost of medicines out-of-pocket. In India, more than 80% health financing is borne by patients.

Maximum and minimum Cost of the fluoroquinolones eye drops belong to different pharmaceutical companies was calculated.

Difference in the maximum and minimum price of the same drug formulation manufactured by different pharmaceutical companies and percentage variation in price was calculated.

Percentage cost variation was calculated as follows:

\[
\text{Percentage cost variation} = \frac{\text{Maximum cost} - \text{Minimum cost}}{\text{Minimum cost}} \times 100
\]

Cost ratio = Price of costliest brand ÷ Price of least costly brand
Patients have to pay more unnecessarily if costly brands are prescribed. Many poor people frequently face a choice between buying medicines or buying food. In India, more than 80% health financing is borne by patients. The situation becomes more complex due to the presence of number of brands with variety of names and prices. The price variation assumes significance when the cost ratio exceeds 2 and percentage cost variation exceeds 100. By this fact the above analysis showed that cost ratio and percentage cost variation of Ofloxacin (0.3%, 10 ml), Sparfloxacin (0.3%, 5 ml), and Lomefloxacin (0.3%, 5 ml) is below 2 and 100, so these drugs do not show significant price variation and these drugs can be prescribed in poor patients. Significant price variation creates economic burden on poor patients. Costs of drugs are controlled by the drug cost control order 2013 (DPCO). Hence, we need to draw attention to the prices of various drug formulation brands available to reduce the cost of therapy. The treating physician should be made aware of the cheapest drug available among the various brands so that the patient bears lesser burden of treatment cost. In India, doctors have less awareness in the cost difference of different brands of the same drug. It is felt that physicians could provide better services and reduce costs of drugs if information about drug prices was readily available.

CONCLUSION

In today's prices of few drugs are under government control through DPCO. Hence the physician should always remember that he should not avoid treating the patients with a particular drug because it is expensive and should rather balance his therapeutic decisions in prescribing a particular drug by considering the patients socioeconomic status. There is a strong need to create awareness about this huge price variation among the general public, health care providers, health care payers, government agencies, policy makers, pharmacists for appropriate intervention to reduce economic burden on patients as well as the healthcare system.
