ABSTRACT

Background: The novel coronavirus disease 2019 (COVID-19) has had many impacts on the education sector. The pandemic has had negative impacts on the academic activities of nursing students globally. Therefore, we assessed the impact of the COVID-19 on final year nursing students’ academic activities in Lusaka and Mufulira districts of Zambia.

Methods: This was a cross-sectional study that employed quantitative methods using a structured questionnaire among 196 final year nursing students from 1 August 2020 to 30 September 2020. Data were analysed using the statistical package for social sciences (SPSS) version 21.

Results: A female predominance (67.9%) and a response rate of 86% were obtained. Many students strongly agreed (32.7%) and agreed (20.4%) that they did not complete their course work resulting in some concepts being poorly taught, 86.1% strongly agreed that they had delayed final examinations, and 51.5% strongly agreed that they did not do their clinical attachments. Students strongly disagreed (40.3%) that the e-library and wireless facilities in their school were well-stocked. Hence, this resulted in some students (40.3%) missing class lessons and assessments.

Conclusions: The COVID-19 epidemic has negatively affected the academic activities of nursing students in Zambia. Ministries responsible for education must put in place measures that will mitigate the impact of COVID-19 on the education sector. Schools must adapt to the changes in the way of conducting learning and assessment sessions. Finally, schools must improve on their e-library and wireless facilities to effectively support online learning.

INTRODUCTION

The ongoing novel coronavirus disease (COVID-19) pandemic emerged from China in 2019.1 COVID-19 is a respiratory tract disease that is transmitted from person to person through droplets from an infected person who coughs or sneezes.2,3 The pandemic has caused a lot of economic and education instability throughout the world.4,5 Therefore, this has resulted in extraordinary measures to contain the pace or reduce the impact of COVID-19.6,7 The COVID-19 pandemic has affected educational systems worldwide, leading to partial and total closure of schools, universities and colleges.5 As of mid-April 2020, approximately 1.723 billion learners were affected due to school closures in response to the pandemic.9 According to UNESCO monitoring, 191 countries implemented nationwide closures as well as local closures, impacting about 98.4% of the world's
student population.\textsuperscript{10} School closures may have an impact on the students, teachers and families, economic and societal consequences.\textsuperscript{11,12}

It was also noted that nursing schools were not spared by the closures because of the COVID-19 outbreak.\textsuperscript{13,14} Many medical programs were struggling to find ways to meet students’ clinical experiences and run online classes.\textsuperscript{15} In many countries, governments had implemented lockdown measures to curb the spread of COVID-19.\textsuperscript{16-18} Previous studies have shown that the closure of educational institutions is an effective strategy for breaking the critical transmission chain during the pandemic.\textsuperscript{19-22}

The COVID-19 pandemic has caused negative consequences on students’ academic study, including learning interruptions, disruption to assessment, and the impact is more severe on students from disadvantaged backgrounds.\textsuperscript{15} The nationwide closure of educational institutions, i.e. schools, colleges, and universities has adversely impacted over 60% of the world’s student population.\textsuperscript{23} The delay in re-opening educational institutions can negatively affect the mental state and academic growth of students.\textsuperscript{24} The long-time home quarantine period caused disturbance and deterioration in students’ study habits and performance of work, which eventually resulted in the growth of stress and dysfunctional learning behaviours.\textsuperscript{25} Further, it has been observed that students and the general population have experienced psychological challenges as a result of COVID-19; this could affect their academic performance.\textsuperscript{2,20} Zambia, a country in the Centre of the Southern African Region only had its first two cases reported on the 18\textsuperscript{th} of March 2020.\textsuperscript{27,28} This resulted in the Zambian government announcing that all schools, colleges and universities were to be closed on Friday the 20\textsuperscript{th} of March 2020.\textsuperscript{29} Due to the premature closure of education institutions, Colleges and Universities had employed technologically driven learning and assessment through online platforms such as Moodle and the open-source learning management (LMS) framework. Built on pedagogical principles, Moodle was used in learning institutions, workplaces and other sectors for blended learning, distance education, flipped classroom and other e-learning projects.\textsuperscript{30} The closure of learning institutions necessitated by the need to curtail the spread of COVID-19, should not completely deny learners access to learning. Therefore, our study focused on assessing the impact of COVID-19 on the academic activities of final year nursing students in Lusaka and Mufulira districts of Zambia.

**METHODS**

**Study design and sites**

This was a cross-sectional study that was conducted using a structured questionnaire in which quantitative methods were employed. The study was conducted in the Lusaka and Copperbelt provinces of Zambia, specifically in Lusaka and Mufulira districts from 1 August 2020 to 30 September 2020. The study was conducted at Lusaka colleges of nursing and Midwifery, Lusaka Apex medical university and Mufulira school of nursing.

**Data collection**

Data were collected using a structured questionnaire that was pre-tested among 12 final year nursing students. The pre-test was done to determine the accuracy, consistency, appropriateness, and easiness.

The questionnaire was used to collect data on the sociodemographic characteristics of the participants, effects of COVID-19 on academic activities and the suggested measures to effectively support the academic progression of the nursing students. A Likert scale was used to measure the responses on the effects of COVID-19 on the academic activities of final-year nursing students. The responses included; agree, disagree, neutral, strongly agree, and strongly disagree.

**Sample size determination and sampling technique**

A sample size of 207 final year nursing students was determined using Yamane's formula:\textsuperscript{31}

\[
n = \frac{N}{1+N(e)^2}
\]

We used a research population of 425 final-year nursing students from the three nursing schools, and a margin of error of 5% at 95% confidence level. We took into consideration a 10% loss or non-response. We randomly circulated 228 questionnaires of which 196 were completed by the final-year nursing students. A purposive sampling technique was employed in our study.

**Inclusion criteria**

All the final-year nursing students studying at Lusaka College of Nursing and Midwifery, Lusaka Apex medical university and Mufulira school of nursing and Midwifery were included in the study.

**Exclusion criteria**

All final-year nursing students who did not provide consent to participate in the study were excluded from the study.

**Data analysis**

The collected data were entered into a Microsoft excel sheet and imported into the statistical package for social sciences (SPSS) version 21.0 for analysis. The results were presented in form of tables.
RESULTS

Sociodemographic characteristics

A response rate of 86% was achieved. The study found a female predominance (67.9%) of which the majority 71(36.2%) came from the Lusaka College of Nursing and Midwifery as shown in (Table 1).

Most students strongly agreed that COVID-19 caused failure to complete course content (32.7%), concepts poorly taught (41.3%), delayed their examinations (86.1%), and prevented students from doing their clinical attachments (51.5%) (Table 2). Most students strongly disagreed (40.3%) that their school has an effective e-library. The students strongly agreed (40.3%) that some students missed assessments and lectures due to poor access to the internet and they strongly disagreed (36.7%) that their school has effective wireless facilities to be used for online learning (Table 3).

SD=strongly disagree; D=disagree; N=neutral; A=agree; SA=strongly agree
Most students expected their school to provide face masks (51.9%) and hand sanitisers (46.8%). Most students suggested that their lecturers should do computer refresher courses (40.5%) and the school to improve on stocking of the e-library (49.2%) to improve on online learning (Table 4).

**DISCUSSION**

We assessed the impact of COVID-19 on the academic activities of final year nursing students in Lusaka and Mufulira Districts of Zambia. Our findings show that most students strongly agreed that COVID-19 caused failure to complete course content (32.7%), concepts poorly taught (41.3%), delayed their examinations (86.1%), and prevented students from doing their clinical attachments (51.5%). These results, therefore, mean that the academic performance of students could be affected by such disturbances. These findings were in tandem with the UNESCO 2020 report that deduced that school closures as a result of COVID-19 have a huge impact on the education sector though it was difficult to measure the specific impact.23

In Egypt, Shehata et al similarly reported that students experienced challenges with regards to learning clinical skills due to a lack of clinical placements.32 Evidence has shown that University and College students were worried about their academic progress because of COVID-19 and the introduction of online learning.33,34 Similarly, a study by Charles et al on alcohol abuse among college students during the COVID pandemic reported that students experienced significant educational disruptions as the pandemic interfered with their academic functioning.35 This is because the closure of tertiary-level educational institutions suspended face-to-face teaching-learning sessions hence interrupting the regular flow of academic programs.34,36 Some schools had to postpone or cancel the students’ examinations.37 This can lead to an impact on the mental health and academic performance of the students.4,26,33,38

Current study revealed that students’ periods of clinical attachments were disrupted and shortened due to the pandemic. Similarly, another study reported that the clinical placements of nursing students were cancelled, despite the future nurses being among the frontline workers.15 The lack of an effective clinical learning environment for student nurses prevents them from effective learning and growth.39 As a result, the growth and development of their skills were to be influenced. Studies showed that the students’ non-effective exposure to the clinical learning environment had increased dropout rates. Some nursing students had left the profession as a result of challenges they faced in the clinical settings.39

From current study findings, it can be inferred that nursing schools in Zambia had postponed or rescheduled exams and introduced alternative methods of learning such as online and home-based assessments. The common challenges emerging included issues of fairness and the feasibility of alternative assessments. Noting a distinct trend towards online assessments, it was noted that not all courses and competencies can be assessed online. Similarly, it was reported that there have been challenges regarding the methods of summative assessments using online methods.32 Findings on the effectiveness of online infrastructure suggest that most students strongly disagreed (40.3%) that their school has an effective e-library. The students strongly agreed (40.3%) that some students missed assessments and lectures due to poor internet access and they strongly disagreed (36.7%) that their school has effective wireless facilities to be used for online learning. Goh et al reported that the introduction of online learning was a positive way for continuity of learning, despite the many challenges that technology comes with.40 Some University and College students have little or no access to internet services, making it difficult for them to learn during the COVID-19 pandemic.34

Similarly, it has been reported that successful and sustainable e-learning implementation continues to remain a challenge, particularly in Information and communications technology (ICT) challenged environments such as rural areas.41 This literature acknowledges the fact that there is a disparity in terms of access to ICT in different geographical locations within a country. A study conducted in Bangladesh reported that respondents explained that online education would not be the best way to use for teaching-learning in the context of Bangladesh as many universities did not have enough resources for running online education urgently.30 The participants also said that while some teachers tried to take online classes on their initiatives, they faced some issues regarding virtual learning courses on online platforms. Some of them had no electronic devices such as computers, laptops, smartphones, or tablets to take part in online classes and no internet access at home.

Arguably, in midst of the implementation of the COVID-19 guidelines in Zambia, learning institutions were depending on the online modes of teaching to maintain continuity of education. Schools were launching apps, conducting classes over Google Hangouts or Zoom, and sending interactive worksheets and videos for learning. Even though internet-based teaching was the most appropriate stop-gap arrangement, it had highlighted the inequalities in the education system.36 A majority of the student population were being left out in the pursuit of basic education, especially those facing financial challenges and lack of internet access.33,34

A policy brief by the United Nations policy eluded that in ensuring learning continuity during the time of school closures, it became a priority for governments all over the world to turn to ICT, requiring teachers to move to online delivery of lessons.42 In various countries, some ICT modalities have been used more than others, depending
on education level, with variability across regions. In areas with limited connectivity, governments had used more traditional distance learning modalities, often a mix of educational television and radio programming, and the distribution of print materials. Relatively few countries were monitoring the effective reach and use of distance learning modalities. However, estimates indicated variable coverage: distance learning in high-income countries covers about 80-85 per cent, while this drops to less than 50 per cent in low-income countries. This shortfall was largely attributed to the digital divide, with the disadvantaged having limited access to basic household services such as electricity; a lack of technology infrastructure; and low levels of digital literacy among students, parents, and teachers. All challenges with regards to the use of technology for online learning must be taken into consideration.52-53

With regards to the findings on the measures to be put in place to remedy the effects of COVID-19 on nursing education, final year students indicated that their schools should provide face masks (51.9%) and hand sanitisers (46.8%). Besides, most students (40.5%) suggested that their lecturers should study refresher courses in ICT and (49.2%) recommended that the schools should improve their e-library. According to the United Nations report, many educators lack basic ICT skills.52 Many challenges may arise when students are exposed to a different mode of learning.44-45 However, introducing students to online learning and assessments ensures that they continue learning and never be delayed in their academic progression.46 Blended learning has been found to very effective and allows continuity of learning during physical school closures.47-50 Hence, there is a need for urgent steps to be taken to provide technical resources and improve internet connection for ensuring uninterrupted online education.51 This will in turn fulfil the education needs of tertiary level students in this period of the COVID-19 pandemic.

Strengths and limitations

This study is essential as it provided information on the challenges that were being first by nursing students during the first wave of the COVID-19 pandemic. It was the first ever study to be conducted in Zambia on the impact of COVID-19 of COVID-19 on the academic activities of nursing students. Therefore, the findings of the study are cardinal in developing strategies that addresses the negative impact of COVID-19 on the academic activities of students.

Conversely, the study had some limitations. The study was a cross-sectional study that was conducted among final-year nursing students. Hence, the findings cannot be generated to the other student populace.

CONCLUSION

The COVID-19 pandemic has drastically contributed to nursing training institutions’ failure to complete the course work coverage and late administration of examinations for final year students. The most critical aspect was the inability of the final year students to comprehensively do clinical placements which rendered the training more theoretical. The online infrastructure at the nursing training schools was not effective in supporting effective learning and assessments during the COVID-19 pandemic. It was also established that there was an urgent need to improve the competencies of lecturers and students in the areas of ICT. Learning institutions must put in place measures to mitigate the impact of COVID-19 on the academic activities, mental health and extracurricular activities of students. Therefore, the incorporation of blended learning in the nursing training curriculum is very vital and will help avoid certain challenges in future.

ACKNOWLEDGEMENTS

Authors are thankful to the University of Zambia e-library for providing access to the referencing materials used in this article. Authors are also thankful to the participants and learning institutions where we collected data from.
